FAKE NEWS DETECTION USING NLP

Detecting fake news using Natural Language Processing (NLP) involves a combination of various techniques and components to analyze and classify text data as either authentic or deceptive. Here is a high-level architecture of how this can be accomplished

FLOW CHART:

FLOW CHART :

fake news detection is a challenging task, and the effectiveness of your NLP model will depend on the quality of your data, the chosen model architecture, and the ongoing maintenance and refinement of the system. Additionally, consider ethical considerations and potential biases in the data and models throughout the development process.
